

PYTHON PROJECT

NAME : JAI SURYA E

REG NO : 411625104020

DEPARTMENT : B.E Computer Science Engineering

SUBJECT : PYTHON

BATCH : 4

PROJECT TITLE : Magical Fortune Teller Using Python

AIM

To design and implement a Magical Fortune Teller using Python that predicts answers to user questions randomly. The system allows users to ask questions and receive random fortune predictions using loops, lists, and conditional statements.

OBJECTIVE

- To understand loops and conditional statements in Python**
- To implement menu-driven and interactive programming**
- To use lists to store fortune predictions**
- To simulate a real-world entertainment fortune prediction system**
- To use functions and Python modules like random and time**

TOOLS USED

- **Python 3**
- **VS Code / IDLE / PyCharm**
- **Windows / Linux / Mac Operating System**

DESCRIPTION

This project simulates a simple Magical Fortune Teller System. The user can ask questions about their future, and the program randomly selects a prediction as the answer.

The program uses:

- **Lists to store different fortune predictions**
- **Loops to repeatedly allow the user to ask questions**
- **Conditional statements to control program flow**
- **Random module to select a random fortune**
- **Time module to create a thinking delay effect**

This project demonstrates how Python can be used to build a simple entertainment-based real-world application.

ALGORITHM

- **Start the program**
- **Import random and time modules**
- **Display welcome message**
- **Ask user to enter their name**
- **Create a list containing different fortune predictions**
- **Start a while loop to repeatedly allow questions**

For each iteration:

- **Ask the user to enter a question**
- **Display thinking message with delay**
- **Select a random fortune using `random.choice()`**
- **Display the prediction**

Then:

- **Ask the user if they want another prediction**

- If user enters no, exit the program
- Otherwise continue asking questions

Repeat until the user chooses to exit.

CODING

```
import random
```

```
import time
```

```
print("🔮 Welcome to the Magical Fortune Teller 🔮")
```

```
print("-----")
```

```
name = input("Enter your name: ")
```

```
print("Hello", name + "! Ask me about your future.")
```

```
fortunes = [
```

```
    "Yes 👍",
```

```
    "No ❌",
```

```
    "Maybe 🤖",
```

"Chances are good",

"Uncertain for now",

"It is possible"

]

while True:

question = input("\nAsk your question: ")

if question.strip() == "":

print("Please ask a valid question!")

continue

print("\nThinking...")

time.sleep(2)

answer = random.choice(fortunes)

print("\n 🎰 Your fortune is:")

print(answer)

```
again = input("\nDo you want another prediction? (y/n): ")
```

```
if again.lower() == "n" or again.lower() == "no":
```

```
    print("\nThanks for using the Fortune Teller,", name + "!")
```

```
    print("Have a lucky day 🍀 ")
```

```
    break
```

```
print("Program ended.")
```

OUTPUT

The program allows users to ask questions and receive random fortune predictions.

OUTPUT SCREEN

```
===== RESTART: C:/Users/Admin/OneDrive/Documents/Fortune Teller.py
🔮 Welcome to the Magical Fortune Teller 🔮
-----
Enter your name: JAI SURYA
Hello JAI SURYA! Ask me about your future.

Ask your question: WILL U BE MY VALENTINE??

Thinking...

🔮 Your fortune is:
Yes 🍀

Do you want another prediction? (y/n): n

Thanks for using the Fortune Teller, JAI SURYA!
Have a lucky day 🍀
Program ended.
|
```

RESULT

The Magical Fortune Teller System successfully generates random predictions based on user questions. The program demonstrates the use of lists, loops, conditional statements, and Python modules to create an interactive entertainment application.

CONCLUSION

This project demonstrates how Python can be used to build a simple interactive entertainment application. By using loops, lists, conditional statements, and the random module, the system simulates a fun fortune prediction experience for users.
